My idea for the todo list is that a user will create a new username and password so that they can open their todo list tasks everywhere(tablet, laptop, phone). Then, the display will be similar to nusmods if possible where each task will have the timing and date. The preview of their todo list is weekly per page. This is my goal, but if I don't have time to learn to create the display similar to nus mods, the display will be similar to the figure shown below. The user can choose to either see their task weekly or daily.

Then the user can create new category and add them to each task to make it easier for them to organize. The user can then mark certain task if it is very important with some symbol, so that the user will focus more on that task.

The issues that I might face in making my goal todo list is the relation between user and the todo. The past few weeks I learn new stuff such as class, objects, and of course git. It is not easy but it is fun to learn new stuff. Im not really good with UI design so that might be a problem in making the nusmods display into real, but I will do my best. I also have some issue with using bootstrap 4 into my website, so I will use bootstrap 3 instead, and maybe some other front-end framework. Afterall, these issues help me to self-learn and it has been a fun journey learning new stuffs everyday so far. From learning a new language(Ruby) to knowing what is MVC and how to build simple app using rails.
